                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This present sequence is that of a peptide antagonist of zonulin CC (2), one of 25 such peptides (see Y79105-29) of the invention, CC which bind to a zonula occludens toxin (ZOT) receptor. Yet do not CC which bind to a zonula occludens toxin (ZOT) receptor. Yet do not CC (TI). The peptide antagonists are based on a common motif of ZOT cC and human zonulins, which is believed to be critical for receptor cC antainflammatory agents in the treatment of gastrointestinal cC antianmation, where they bind to the ZOT receptor in the intestinal cC and yet does not physiologically modulate the opening of Ty in the CC increased intestinal permeability and the peptide is useful for cC caused by infection, e.g. Clostridium difficile infection, cc caused by infection, e.g. Clostridium difficile infection, cc caused by infection, e.g. Clostridium difficile infection, cc collagenous colitis, inflammatory bowel disease, diseases with CC correction of congenital nevernital intestinal lymphamatory bowel disease, diseases with CC correction of congenital heart disease with Fontan's obstraction, cc coliac disease, eosinophilic gastroenteritis, and immune disease, cc e.g. systemic lupus erythematosus or food allergies, primarily to

Dinding. They can be prepared by chemical synthesis or by use of recombinant DNA techniques. The peptide antagonists are used as an infilmmation, where they bind to the 207 receptor in the intestinal and yet does not physiologically modulate the opening of Ty in the intestine. Gastrointestinal inflammation conditions give rise to treating intestinal permeability and the peptide is useful for caused by infection, e.g. Clostridium difficile infection, contestinal conditions that cause protein losing enteropathy enterocolitis, shigellosis, viral gastroenteritis, parasite mucosal erosion or ulcerations, e.g. gastritis, gastric cancer, imphatic obstruction, e.g. congenital intestinal lymphoma, mesenteric tuberculosis, and after surgical correction of congenital heart disease, diseases, diseases marked by correction of congenital heart disease with Fontan's operation, colitis, inflammatory bowel disease, disease, diseases, without ulceration, e.g. Menetrier's disease, colical diseases without ulceration, e.g. Menetrier's disease, colical diseases without ulceration, e.g. Menetrier's disease, colical colisases, essimphilic gastroenteritis, and immune diseases, and a site and immune diseases.

The peptide antagonists are used as an antiinflammatory agents in the treatment of gastrointestinal inflammation, where they bind to the 20T receptor in the intestine and yet does not physiologically modulate the opening of TU in the intestine. Gastrointestinal inflammation conditions give rise to increased intestinal permeability and the peptide is useful for treating intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection, enterocolitis, shigellosis, viral gastroenteritis, parasite infestation, bacterial overgrowth, whipple's disease, diseases with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (2), one of 25 such peptides (see Y79105-29) of the invewhich bind to a zonula occludens toxin (ZOT) receptor, physiologically modulate the opening of mammalian tight
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (TJ). The peptide antagonists are based on a common motif of ZOT and human zonulins, which is believed to be critical for receptor and human zonulins, which is believed to be critical for receptor binding. They can be prepared by chemical synthesis or by use of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 1; Page 44; 69pp;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    shigellosis, viral gastroenteritis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI; 2000-205565/18

Sc binding. Tray can be precised antagonists are user antioning manatory agents in the treatment of gastrointestinal antininianmatory agents in the treatment of gastrointestinal condition where they bind to the ZOT receptor in the intestine and yet does not physiologically modulate the opening of TJ in the CC intestine. Gastrointestinal inflammation conditions give rise to increased intestinal permeability and the peptide is useful for treating intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection, enterocolitis, shigellosis, viral gastroenteritis, parasite infestation, bacterial overgrowth, whipple's disease, diseases with confestation, bacterial overgrowth, whipple's disease, diseases with collagenous colitis, inflammatory bowel disease, diseases marked by lymphatic obstruction, e.g. congenital intestinal lymphanglectasia, correction of congenital heart disease with Fontan's operation, concernation, e.g. disease, without ulceration, e.g. menetrier's disease, coeliac disease, eosinophilic gastroenteritis, and immune disease, e.g. systemic lupus erythematosus or food allergies, primarily to
  New peptide antagonist of zonulin useful as antiinflammatory agent treating cerebral ischemia, stroke, cerebral edema, gastritis, shigellosis, viral gastroenteritis, meningitis, encephalomyelitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WO200007609-A1
                                                                                                                                                                                                                                                                                                                                                                                                                                                    and human zonulins, which is believed to be critical for receptor binding. They can be prepared by chemical synthesis or by use of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          which bind to a zonula occludens toxin (20T) receptor, yet do physiologically modulate the opening of mammalian tight juncti
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This present sequence is that of a peptide antagonist of zonulin (2), one of 25 such peptides (see Y79105-29) of the invention,

                                                                                                                                                                                     Peptide antagonist of zonulin.
                                                                                                                                                                                                                                                                                                                                                                                                                      Y36754-Y37949 are encoded by open reading frames (ORFs) of the genome of Chlamydia trachomatis (see Z01425). The polypeptides can be used as can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye paratrachoma, and inclusion conjunctivitis; genital diseases such as conventional trachoma, nonendemic trachoma, nongonococcal uretritis, epidymitis, cervicitis, salpingitis, and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these diseases.

CC (TJ). The peptide antagonists are based on a common motif of ZOT CC and human zonulins, which is believed to be critical for receptor CC binding. They can be prepared by chemical synthesis or by use of CC antiinflammatory agents in the treatment of gastrointestinal cCC inflammation, where they bind to the ZOT receptor in the intestine CC inflammation, where they bind to the ZOT receptor in the intestine CC intestine. Gastrointestinal inflammation conditions give rise to increased intestinal permeability and the peptide is useful for CC treating intestinal conditions that cause protein losing enteropathy CC enterocolitis, shighlosis, viral gastroenteritis, parasite CC infestation, becterial overgrowth, whipple's disease, diseases with CC collagenous colitis, inflammatory bowel disease, diseases with CC lymphatic obstruction, e.g. congenital intestinal lymphangiectasia, CC sarcoidosis lymphoma, mesenteric tuberculosis, and after surgical CC conceilac disease, eosinophilic gastroenteritis, and immune disease, CC enilac disease, eosinophilic gastroenteritis, pararily to

The polypeptides can be used to detect anti-MAP antibodies. The antibodies can be used to detect MAP antigens. The nucleotide sequences can be used to detect MAP antigens. The nucleotide sequences can be used as probes or primers for detecting MAP nucleic acids. The nucleotide sequences, polypeptides, vectors, (pseudo)viral particles, transformed cells and compounds selected by the screening assay can be used in pharmaceutical compositions. The polypeptides, nucleotide sequences, vectors and transformed cells can be used in vaccines against MAP circovirus infection. The vectors, (pseudo)viral particles and

```
Purified carbamate hydrolase can be used to isolate/identify A.oxidans carbamate hydrolase gene system. This system makes plants resistant to the herbicide phenmedipham. Carbamate hydrolase has pH optimum 6.8, mol. wt. 50-60kp, isoelectric point 6.2, and can cleave phenmedipham to methyl 3-hydroxyphenylcarbamate, m-toluidine and CO2, so inactivating it. It is produced by A.oxidans DSM 4044 which contains the 41 kb plasmid
                                                                                                                                                                                                                                                                                                                                                                                                     destroy herbicide phenmedipham, and DNA encoding it, resistance to plants.
                                                                                                                                                                                                                                                                                                                                                           Disclosure; Fig 7; 17pp;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 99US-0147204
99US-0147302
                                                                                                                              This sequence represents the human type II collagen alpha-chain which CC is used in a method to produce an immunoassay kit comprising of two CC antibodies (Ab1 and Ab2), mono- or poly-clonal, or their fragments, CC II collagen fragment that is released from degraded cartilage). The kits immunoassays, specifically enzyme-linked CC serum or synovial fluid). The kits are used for therapy, diagnosis (e.g. cc routhes screening for arthritis and other cartilage diseases, also to CC diagnose growth disorders), prognosis (e.g. monitoring progression of CC growth hormone) and for drug screening (to identify, and assess efficacy of, anti-arthritic agents and matrix metalloprotease inhibitors). CC IIIree, derived from the N-terminus of the alpha I chain, have CC concentration that allows accurate measurement by immunoassay.

                                                                                                                                                                                                                                                                                                  This peptide comprises the first epidermal growth factor-like domain (EGF-1), i.e. amino acid residues 105-135, of human Zneul (see W88381), a new neuro-growth factor-like protein. Zneul can be used as a growth, maintenance, or differentiation factor in the spinal cord, heart, spleen, testis, thyroid and lymph nodes. It may also play a role in breast cancer, glioblastomas, and pituitary adenomas. Zneul may also be used to treat Alzheimer's disease, cancer, to repopulate blood cells after chemotherapy, to stimulate myofibroblast proliferation, stimulate or inhibit growth factors made in the placenta, in fertility and contraception, or to respond to the placenta, in fertility and contraception, or to respond to the placenta, in fertility and contraception, or to respond to the placenta, in fertility and contraception, or to respond to the placenta, in fertility and contraception, or to respond to the placenta, in fertility and contraception, or to respond to the placenta.

                                                                                                                     This claimed polypeptide comprises amino acid residues 105-177 of the human Zneul mature protein (see W88382), i.e. the 2 epidermal growth factor-like domains (see also W88384-85) of Zneul. Zneul is a new neuro-growth factor-like protein that can be used as a growth, maintenance, or differentiation factor in the spinal cord, heart, spleen, testis, thyroid and lymph nodes. Zneul may also play a role in breast cancer, glioblastomas, and pituitary adenomas. Zneul can be used to treat Alzheimer's disease, cancer, to repopulate blood cells after chemotherapy, to stimulate myofibroblast proliferation, stimulate or inhibit growth factors made in the placenta, in fertility and contraception, or to regenerate nerves. Claimed Zneul polypeptides (see also W88382-97), including specific domains of Zneul and epitope-bearing portions of Zneul, can be used to raise specific antibodies for use e.g. in

FUNCTION: THIS PROTEIN IS THE SURFACE ANTIGEN OR IMMOBILIZATION ANTIGEN OF PARAMECIUM PRIMAURELIA.

SUBCELLULAR LOCATION: ATTACHED TO THE MEMBRANE BY A GPI-ANCHOR.
MISCELLANEOUS: IT HAS INVERNAL HOMOLOGIES AND A HIGHLY PERIODIC STRUCTURE WITH 37 PERIODS OF ABOUT 75 RESIDUES, EACH PERIOD CONTAINING 8 CYSTEINES, EXCEPT FOR FOUR HALF PERIODS. A VARIABLE PART OF 475 RESIDUES, COMPRISES 4 ALMOST IDENTICAL PERIODS IN THE
                                                                                                                                                                                                                                                                                                               THE

E6.5, PROMINENT EXPRESSION OBSERVED IN DIFFERENCIATED DECIDUA. AT E7.5, INTENSE EXPRESSION IN EXTRABBRYONIC ENDODERM, AMNOIN AND NASCENT MESODERM. AT 8.5, ABUNDANT EXPRESSION IN SOMITES AND YOLK SAC FOLLOWED BY A CONFINATION TO DERMAMYOTOME COMPARTMENT. BETWEEN E9.5 AND E11.5, ABUNDANT EXPRESSION IN AER (THICKENED ECTODERMAL CELLS OF LIMB BUDS). AT E12.5, EXPRESSION IN THE LIMBS IS CONFINED TO THE CONDENSING MESENCHYM SURROUNDING THE CARTILAGE. AT THIS STAGE, STRONG EXPRESSION ALSO DETECTED IN VERTEBRAL AND FACIAL CARTILAGE PRIMORDIA AND IN THE MYSCLE OF THE TONGUE. AT E16.5, ABUNDANT EXPRESSION IN EPITHELIAL CELLS OF THE INTESTINAL VILLI. ISOFORM B OCCUR AT E12.5.

-I. DOMAIN: THE PROPERTIDE DOMAIN ACTS AS AN INTRAMOLECULAR CHAPERONE ASSISTING THE FOLDING OF THE ZYMOGEN WITHIN THE ENDOPLASMIC
```

RETICULUM

SIMILARITY: BELONGS TO SUBTILASE FAMILY. DOMAIN: AC 1 AND AC 2 (CLUSTERS OF ACIDIC AMINO ACIDS) SORTING INFORMATION. AC 1 DIRECTS TGN LOCALIZATION AND WITH THE TGN SORTING PROTEIN PACS-1. PEPTIDASE FAMILY ; 8s ALSO KNOWN AS CONTAIN

SIMILARITY: CONTAINS 1 HOMO B/P DOMAIN
